ADDS - Practical 7: Polymorphism and Complexity

Diana Guevara ID 1711891

1. DIAGRAM OF CENTRAL CLASSES:

Individual

- binaryString: String
- Bit_List: vector<int>
- ones: intlength : int
- + stringgetString()
- + intgetBit(intpos)
- + voidflipBit(intpos)
- + intgetMaxOnes()
- + intgetLength()

Mutator

- offspring: vector<int>
- p: double
- + virtual mutate (int k, vector<int> dna) : vector<int>

BitFlip

+ mutate (int k, vector<int> dna) : vector<int>

Rearrange

+ mutate (int k, vector<int> dna): vector<int>

BitFlipProb

+ mutate (int k, vector<int> dna) : vector<int>

2. EXPLANATION OF CORE FUNCTION:

Individual: string getString() - Basivc get int getBit(intpos) void flipBit(intpos) int getMaxOnes() int getLength() **Mutator**: mutate (int k, vector<int> dna): vector<int> Call recursively the function using k as index to move and change the vector dna depending of the derivate class. Individual* execute(Individual* indPtr, Mutator* mPtr, int k): Main: The main function for this program, created a BitFlip, BitFlipProb and a Rearrange objects, Individual* pointer, Mutator* pointerand call the Individual* execute (Individual* indPtr, Mutator* mPtr, int k) funtion.

3. TESTING: Following is a description of the test cases that will be used to test my program.

Given input	Rationale	I expect output
000000 2 0111 2	Test the example input giving in the practical.	010000 1110 3
001100 7 011100 3	Test the second example input giving in the practical.	101100 110001 2
